

# Let's drive smarter. Let's think bigger.

Let's create a movement, a community, and together we'll change the way we move. At EVmatch we're empowering electric vehicle (EV) owners with more and more reliable charging options.

## EVmatch is a network of residential charging stations.

You charge at someone's private residence and pay them like any other charging network. Make sure you book a station near your final destination so you can easily drop off your car to charge.

Ease of home charging - anywhere.

*Estimated cost of electricity + Host access fee + 20% EVmatch service fee = Total charging price*

### How much does it cost?

Charging prices are based on the cost of electricity to charge your car, plus the host access fee and EVmatch service fee. Prices typically range from \$1-2.50/hr. You can calculate the price of any charging transaction and compare prices between different hosts and time periods.

All EVmatch charging stations are reservable in advance. In a few quick clicks, you can find, reserve, and pay for a station, knowing exactly when and where you'll charge before you leave your home.

EVmatch supports Level 1 & Level 2 charging for all EV models including Tesla.

# Power to the People

## Host Your Charging Station With EVmatch

With EVmatch you can bring energy to the community on your terms. Host your charging station (L1 or L2) and get paid for it. Drivers get more charging and your station gets some extra love during all those hours it's not being used.

### Hosting How To:

#### 1 Host a Station

List your station on the EVmatch community charging network.

#### 2 Review Requests

Approve or deny charging requests you receive.

#### 3 Provide Access

Make your station available for approved charging sessions.

#### 4 Get Paid

Transfer earnings to your bank or convert them to charging credit.

### Create a Listing

Sign up in minutes by providing your address, availability, and a few details about your station. Your address is not displayed to the public, and will only be available to EV drivers you first approve to charge at your home. To sign up you will need to know your utility company, rate structure, and the voltage/amperage of your station. With this information we can accurately estimate and compensate you for the electricity you provide other EV drivers.

### Getting Paid

Your earnings are stored in your EVmatch account until you choose to either disburse them to your bank account or use them to charge your own car. Hosts are always credited for the estimated cost of electricity PLUS the "access fee" they select (\$0-\$10/hr, \$1.50/hr avg). This way you don't have to worry about varying costs to charge others based on time of day or the type of car you're charging.

### Have Solar?

Awesome! Solar hosts enter their utility company and rate structure like any other host, and we calculate electricity costs based on their cost of electricity from the grid. You can let others know you have solar in your listing description.
